## VALVE DESCRIPTION

D05 valves operate efficiently, with large internal flow passages and uniform flow areas throughout the body coring.

Low pressure drop is enhanced with the use of the Dynex standard subplate, which takes advantage of the valve's special double tank port design.

UL Classification:

Class I, Group C, D;  
Class II, Group E, F, G.

## CSA/UL Recognized ("C" Option)

Solenoid coils are printed with the symbol:

This option is available with "115DF" standard AC solenoids only. For availability with other voltages, contact the Dynex sales department.

## VALVE FLOW CAPACITY

Flow capacity depends on valve actuator, internal operator and spool type.

## Solenoid Models

The flow capacity curves, above, show typical performance for each internal operator and spool type. The letters in the "Flow Curve Reference" table identify the appropriate curve.

# D05 PATTERN

## Lever Operated Models

Manual models are rated for 20 U.S. gpm (76 L/min) nominal flow at 5000 psi (350 bar). Higher flows may be possible with some models. Contact the Dynex sales department to discuss your application.

## Pilot Operated Models

The nominal flow capacity for most pilot operated valves is 20 U.S. gpm (76 L/min).

Maximum flow for pilot operated valves is dependent on pilot pressure. The table shows the minimum pressure required to shift the spool, for various flow capacities.

Maximum Pilot Pressure:

Hydraulic, 3000 psi (210 bar);  
Air, 200 psi (14 bar).

Required Volume (to shift spool full stroke):  
Hydraulic, 0.018 in<sup>3</sup> (0,30 cm<sup>3</sup>);  
Air, 0.640 in<sup>3</sup> (10,49 cm<sup>3</sup>).

## Minimum Pilot Pressure

	36	25	1,7	30	2,1	35	2,4

<sup>①</sup> The values listed are based on zero tank pressure. As back-pressure increases above zero, the minimum pilot pressure must be increased by the same amount.

## VALVE EFFICIENCY

D05 valves provide exceptionally low pressure drop, as shown in the performance curves. The values indicate typical performance using the Dynex standard subplate, which takes advantage of the valve's special double tank port design.

Flow may be limited for certain spools. See "Flow Capacity" curves on page 2.

## Determining Pressure Drop

The curves show typical resistance to flow for various spool types. The table identifies the proper pressure drop curve for each spool and flow path.

## An Example

In the table under spool Type 1, curve "D" is called out to determine the pressure drop for P→A. Looking at the curves, "D" indicates a drop of about 28 psi at 12 U.S. gpm (1,9 bar at 45 L/min).

To determine total "loop" drop, the individual pressure drops for P→A and B→T (or P→B and A→T) must be added.

## INSTALLATION AND DIMENSIONS

### Valve Mounting

D05 valves have a second "T" port into a common tank passageway, for lower pressure drop. The mounting surface drawing shows the standard N.F.P.A. pattern, with the optional second "T" port.

Port o-rings are included with valves.

Mounting bolts must be ordered separately: .250-20 U.N.C. Threaded x 1.00 inch (25,4 mm), Grade 8 or better, four required. Recommended mounting torque is 12 lb·ft (16 N·m).

Recommended Minimum Mounting Surface, N.F.P.A. D05 (CETOP 5) Pattern With Two Ports (T) Into Common Tank Passageway
